AQUALYX[®]

World Leading
FAT DISSOLVING SOLUTION

INFORMATION RESERVED FOR THE MEDICAL PROFESSION. FORBIDDEN TO RELEASE TO THE GENERAL PUBLIC IN ANY FORM

WHAT IS AQUALYX?

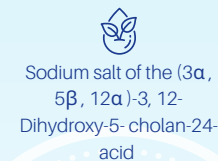

Aqualyx is a **safe, effective and painless** non-surgical treatment, that reduces fat cells in targeted areas of the body. With just a few simple treatments, fat pockets can be broken down producing **visible results** within the first **2 treatments**.

Numerous scientific studies published in the last century have essentially demonstrated, as with solutions based on phosphatidylcholine used "off label" for the non-surgical reduction of localized adiposities and sodium deoxycholate, the active ingredient in adipocitolysis was the detergent (sodium deoxycholate) and not the phosphatidylcholine. However, the use of deoxycholate sodium salt alone produced serious tissue necrosis, given the lack of selectivity and the high degree of aggressiveness of the detergent.

Based on these concepts, in 2004, Prof. Motolese started to work on a new formulation that would act by selectively destroying the fat cells (adipocitolysis) without damaging neighbouring tissues.

This study resulted in the development of a new product, highly selective for adipose cells - Aqualyx® -. Aqualyx® is a microgelatinous solution containing micro quantities of molecules with an adipocitolytic action (derived from the sodium deoxycholate) with a short half-life capable of modulating and intensifying the effect on adipose tissue.

OUR UNIQUE FORMULA

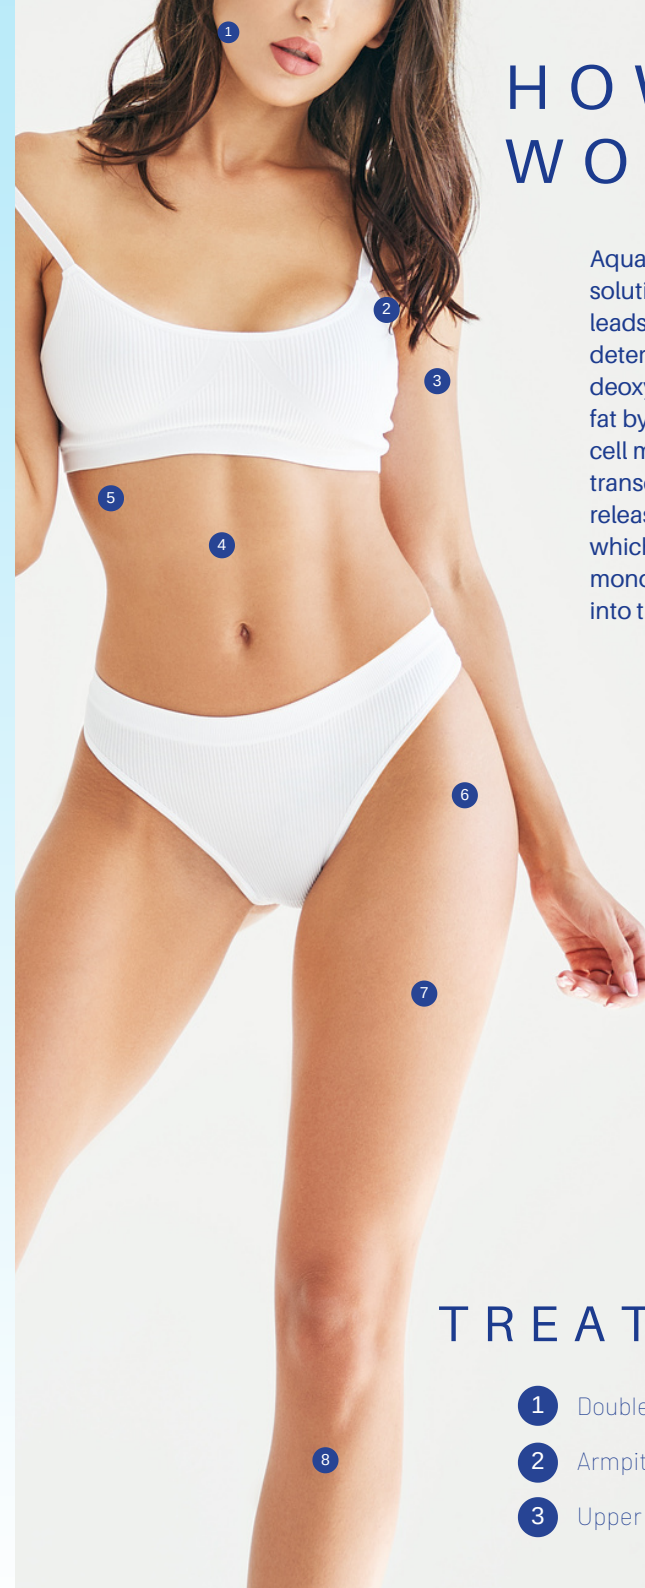

Buffer System

Water

D-Galactose

Na Cl

3,6-Anhydro-L-Galactose

HOW DOES IT WORK?

Aqualyx® is a phosphatidylcholine **free** solution, in which the principal-agent which leads to the destruction of the fat cells is a detergent (weakened sodium deoxycholate). The detergent dissolves the fat by means of emulsification of the adipose cell membrane. Aqualyx®, thanks to its easy transdermal delivery, provokes cellular lysis releasing cellular debris and triglycerides, which are progressively disposed of by the monocyte-macrophage system and drain into the lymphatic system.

Motolese's Solution **AQUALYX®** IDEAL PATIENT

The ideal candidate for Aqualyx treatment will present **stubborn pockets of fat** which are unresponsive to normal metabolic actions (low-calorie diets and physical activity).

For example, women can **successfully treat** stubborn fat pads present in anatomical areas such as hips, buttocks, inner and outer thigh. Male patients can easily reduce abdominal fat and double chin. Aqualyx is not suitable for obese or significantly overweight patients.

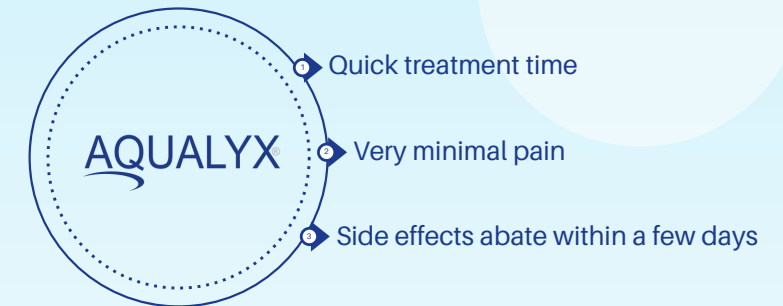

TREATMENT AREAS

- 1 Double Chin
- 2 Armpits
- 3 Upper arms
- 4 Waist
- 5 Back
- 6 Buttocks
- 7 Thighs
- 8 Knees

SAFETY INFORMATION

UNSUITABLE PATIENT FOR AQUALYX

- ✗ Patients that present active or systematic acute pathologies in the area to be treated
- ✗ Patients with diseases affecting organs or organ systems in an acute phase or with evident functional deficits
- ✗ Patients with severe autoimmune diseases
- ✗ Immunosuppressed patients & pregnant or breastfeeding women

PACKAGING

The product is provided in a package of 10 vials, each one containing 8 ml of product.
